Summary

Prior knowledge check

Prior knowledge check

1 Rearrange to make t the subject:

a $x = 4t - kt$ **b** $y = 3t^2$ **c** $y = 2 - 4 \ln t$ **d** $x = 1 + 2e^{-3t}$

← GCSE Mathematics; Year 1, Chapter 14

2 Write in terms of powers of $\cos x$:

a $4 + 3 \sin^2 x$ **b** $\sin 2x$

c $\cot x$ **d** $2 \cos x + \cos 2x$ ← Section 7.2

3 State the ranges of the following functions.

a $y = \ln(x + 1), x > 0$ **b** $y = 2 \sin x, 0 < x < \pi$

c $y = x^2 + 4x - 2, -4 < x < 1$ **d** $y = \frac{1}{2x + 5}, x > -2$

← Section 2.2

4 A circle has centre $(0, 4)$ and radius 5. Find the coordinates of the points of intersection of the circle and the line with equation $2y - x - 10 = 0$.

← Year 1, Chapter 6

8.1) Parametric equations

Notes

Worked Example

A curve has parametric equations

$$x = 3t, \quad y = t^2, \quad -4 < t < 4$$

Find:

- A Cartesian equation of the curve in the form $y = f(x)$
- The domain and range of $f(x)$
- Sketch the curve

Worked Example

A curve has parametric equations

$$x = \ln(t + 5), \quad y = \frac{1}{t + 7}, \quad t > -4$$

Find:

- A Cartesian equation of the curve in the form $y = f(x)$
- The domain and range of $f(x)$

Worked Example

A curve has parametric equations

$$x = \ln t, \quad y = t^3 - 4, \quad t > 0$$

Find:

- a) A Cartesian equation of the curve in the form $y = f(x)$
- b) The domain and range of $f(x)$

Worked Example

A curve has parametric equations

$$x = \frac{3t}{1-t}, \quad y = 5t + \frac{2}{t},$$

Show that the Cartesian equation of the curve is

$$y = \frac{ax^2 + bx + c}{x(x+3)}$$

where a , b and c are constants to be found.

8.2) Using trigonometric identities

Notes

Worked Example

A curve has parametric equations

$$x = \sin t - 2, y = \cos t + 3, t \in \mathbb{R}$$

Find:

- a) A Cartesian equation of the curve in the form $y = f(x)$
- b) Sketch the curve

Worked Example

A curve has parametric equations

$$x = 2 \sin t, y = 3 \cos t, t \in \mathbb{R}$$

Find a Cartesian equation of the curve in the form $y = f(x)$

Worked Example

A curve has parametric equations

$$x = \cos t, \quad y = \sin 2t, \quad -\frac{\pi}{2} \leq t \leq \frac{\pi}{2}$$

Find:

- a) A Cartesian equation of the curve in the form $y = f(x)$
- b) The valid domain and range of $f(x)$

Worked Example

A curve has parametric equations

$$x = 4 \cos t, \quad y = \cos 2t - 1, \quad 0 \leq t \leq \pi$$

Find a Cartesian equation of the curve in the form

$y = f(x)$, $-k \leq x \leq k$, stating the value of the constant k

Worked Example

A curve has parametric equations

$$x = \cot t + 1, \quad y = \operatorname{cosec}^2 t - 3, \quad 0 < t < \pi$$

Find a Cartesian equation of the curve in the form $y = f(x)$ and state the domain of x for which the curve is defined

Worked Example

A curve has parametric equations

$$x = \sqrt{5} \sin 2t, \quad y = 10 \sin^2 t, \quad 0 \leq t < \pi$$

Find a Cartesian equation of the curve

Worked Example

A curve has parametric equations

$$x = 2 \sin t, \quad y = \sin \left(t + \frac{\pi}{6} \right), \quad -\frac{\pi}{2} < t < \frac{\pi}{2}$$

Find a Cartesian equation of the curve in the form $y = f(x)$ and state the domain of x for which the curve is defined

Worked Example

A curve has parametric equations

$$x = \tan t, \quad y = 5 \sin(t - \pi), \quad 0 < t < \frac{\pi}{2}$$

Find a Cartesian equation of the curve

8.3) Curve sketching

Notes

Worked Example

Draw the curve given by the parametric equations

$$x = 3t, \quad y = t^2, \quad -5 \leq t \leq 1$$

Worked Example

Draw the curve given by the parametric equations

$$x = 2 - t, \quad y = t^2 - 3, \quad -3 \leq t \leq 2$$

Worked Example

Draw the curve given by the parametric equations

$$x = 2 \cos t - 3, \quad y = 4 \sin t, \quad 0 \leq t \leq 2\pi$$

8.4) Points of intersection

Notes

Worked Example

A curve C is given by the parametric equations

$$x = at^2 + t, \quad y = a(t^3 + 27), \quad t \in \mathbb{R},$$

where a is a non-zero constant.

Given that C passes through the point $(-6, 0)$,

a) find the value of a .

b) find the coordinates of the points A and B where the curve crosses the y -axis.

Worked Example

A curve C is given by the parametric equations

$$x = t^2, \quad y = 2t, \quad t \in \mathbb{R}$$

Find the coordinates of the point(s) of intersection between the curve C and the line $x + y - 8 = 0$

Worked Example

A curve C is given by the parametric equations

$$x = \cos t - \sin t, \quad y = \left(t + \frac{\pi}{6}\right)^2, \quad -\frac{\pi}{3} < t < \frac{3\pi}{2}$$

- a) Find the point where the curve intersects the line $y = \pi^2$.
- b) Find the coordinates of the points where the curve cuts the y -axis.

Worked Example

A curve C is given by the parametric equations

$$x = 1 - \frac{1}{3}t, \quad y = 3^t - 1, \quad t \in \mathbb{R}$$

Find the coordinates of the x and y intercepts

Worked Example

A curve C is given by the parametric equations

$$x = e^{3t}, \quad y = e^t + 1, \quad t \in \mathbb{R}$$

A straight line l passes through the points A and B where $t = \ln 3$ and $t = \ln 4$ respectively.

Find an equation for l in the form $ax + by + c = 0$

8.5) Modelling with parametric equations

Notes

Worked Example

A plane's position at time t seconds after take-off can be modelled with the following parametric equations:

$$x = (v \cos \theta)t \text{ m}, \quad y = (v \sin \theta)t \text{ m}, \quad t > 0$$

where v is the speed of the plane, θ is the angle of elevation of its path, x is the horizontal distance travelled and y is the vertical distance travelled, relative to a fixed origin.

When the plane has travelled 500m horizontally, it has climbed 125m.

Given that the plane's speed is 40 m s^{-1}

- a) find the parametric equations for the plane's motion.
- b) find the vertical height of the plane after 20 seconds.
- c) show that the plane's motion is a straight line.
- d) explain why the domain of t , $t > 0$, is not realistic.

Worked Example

The motion of a figure skater relative to a fixed origin, O , at time t minutes is modelled using the parametric equations

$$x = 4 \cos 10t, \quad y = 6 \sin \left(5t - \frac{\pi}{3} \right), \quad t \geq 0$$

where x and y are measured in metres.

- Find the coordinates of the figure skater at the beginning of his motion.
- Find the coordinates of the point where the figure skater intersects his own path.
- Find the coordinates of the points where the path of the figure skater crosses the y -axis.
- Determine how long it takes the figure skater to complete one complete figure-of-eight motion.

Worked Example

A stone is thrown from the top of a 50 m high cliff with an initial speed of 5 ms^{-1} at an angle of 30° above the horizontal. Its position after t seconds can be described using the parametric equations

$$x = \frac{5\sqrt{3}}{2}t \text{ m}, \quad y = \left(-4.9t^2 + \frac{5\sqrt{3}}{2}t + 50\right) \text{ m}, \quad 0 \leq t \leq k$$

where x is the horizontal distance, y is the vertical distance from the ground and k is a constant.

Given that the model is valid from the time the stone is thrown to the time it hits the ground,

- find the value of k
- find the horizontal distance travelled by the stone once it hits the ground

Extract from Formulae book

Trigonometric identities

$$\sin(A \pm B) = \sin A \cos B \pm \cos A \sin B$$

$$\cos(A \pm B) = \cos A \cos B \mp \sin A \sin B$$

$$\tan(A \pm B) = \frac{\tan A \pm \tan B}{1 \mp \tan A \tan B} \quad (A \pm B \neq (k + \frac{1}{2})\pi)$$

$$\sin A + \sin B = 2 \sin \frac{A+B}{2} \cos \frac{A-B}{2}$$

$$\sin A - \sin B = 2 \cos \frac{A+B}{2} \sin \frac{A-B}{2}$$

$$\cos A + \cos B = 2 \cos \frac{A+B}{2} \cos \frac{A-B}{2}$$

$$\cos A - \cos B = -2 \sin \frac{A+B}{2} \sin \frac{A-B}{2}$$

Logarithms and exponentials

$$\log_a x = \frac{\log_b x}{\log_b a}$$

$$e^{x \ln a} = a^x$$

Past Paper Questions

A2 SAMs Paper 1

Parametric Equations

5. A curve C has parametric equations

$$x = 2t - 1, \quad y = 4t - 7 + \frac{3}{t}, \quad t \neq 0$$

Show that the Cartesian equation of the curve C can be written in the form

$$y = \frac{2x^2 + ax + b}{x + 1}, \quad x \neq -1$$

where a and b are integers to be found.

Summary of Key Points

Summary of key points

- 1** A curve can be defined using parametric equations $x = p(t)$ and $y = q(t)$. Each value of the parameter, t , defines a point on the curve with coordinates $(p(t), q(t))$.
- 2** You can convert between parametric equations and Cartesian equations by using substitution to eliminate the parameter.
- 3** For parametric equations $x = p(t)$ and $y = q(t)$ with Cartesian equation $y = f(x)$:
 - the domain of $f(x)$ is the range of $p(t)$
 - the range of $f(x)$ is the range of $q(t)$
- 4** You can use parametric equations to model real-life situations. In mechanics you will use parametric equations with time as a parameter to model motion in two dimensions.
